Integrity Self-Check Report // AuraComply

Product ID: system_audit | Client: AuraComply_HQ
Generated: 2026-10-16T23:06:15.468646+00:00
Kernel: dev (unreleased) | Payload schema v1.4.0

Internal self-check. Not a third-party certification. Known limitation: a privileged operator who rewrites the chain and recomputes every subsequent hash produces an internally consistent chain; this is not yet detected automatically.

1. Operational integrity seal

This report is generated from the append-only JSONL mirror of this self-check. The SHA-256 below covers the whole mirror file: any later modification of it changes this hash.

SHA-256 (Traceability Mirror):
`babaa5b75ea58285bbc1ed71af57be2068456dbad710f0aa515a620750706449`

2. Check log

Steps recorded by this self-check run, with the result and detail of each check. These are self-check steps, not AI decisions.

Timestamp	Event	Detail
23:06:15	certify_start	Starting integrity self-check run
23:06:15	check_integrity_self	PASS: hash[:16]=9edcb150642839bc (deterministic, data-sensitive)
23:06:15	check_db_connectivity	PASS: SELECT 1 OK
23:06:15	check_clients_table	PASS: all required columns present (6 total)
23:06:15	check_audit_logs_schema	PASS: all required columns present
23:06:15	check_rls_enabled	PASS: RLS enabled on audit_logs
23:06:15	check_no_plaintext_tokens	PASS: all api_token_hash entries are 64-char hex
23:06:15	certify_verdict	PASS

3. Privacy controls (GDPR Art. 32(1)(b))

In accordance with Article 32(1)(b) of the GDPR (EU 2016/679) — *integrity and confidentiality of processing* — AuraComply enforces a structural PII boundary at the API: payloads matching email, IBAN, PAN, US SSN, Spanish NIF/NIE, or E.164 phone formats are rejected with HTTP 400 and never reach the audit chain. Semantic PII (names, free-text identifiers, addresses) is contractually excluded under the API Terms of Service and is the responsibility of the calling system. The tamper-evident chain shows that recorded events were not altered; it does not detect semantic PII.
